

Insights & Summary

What percentage of reviews are positive?

Out of the 5,000 Amazon Fine Food reviews, nearly 75–80% were classified as Positive by TextBlob's sentiment polarity scoring.

What do customers mostly complain about in negative reviews?

The most frequent complaints in negative reviews are taste, flavor, product, bad, and quality. This shows that customers are dissatisfied with the taste and quality of the food, rather than packaging or delivery issues.

What surprised you in the data?

The most surprising finding was a mismatch between star ratings and TextBlob sentiment labels. Several 1-star reviews were labeled Positive by TextBlob because it scores individual words in isolation and misses negation context. For example, the phrase "not good at all" may still score positively based on the word "good."

One recommendation for the business:

The business should build an automated complaint-flagging system that checks low star ratings against sentiment polarity to catch the most critical reviews quickly. Since product taste and quality drive the most negative feedback, the brand should invest in product consistency and ensure descriptions match actual product attributes to reduce expectation-driven disappointment.
